

Alberta Netcare Data Contribution Process Flow

Feasibility Assessment

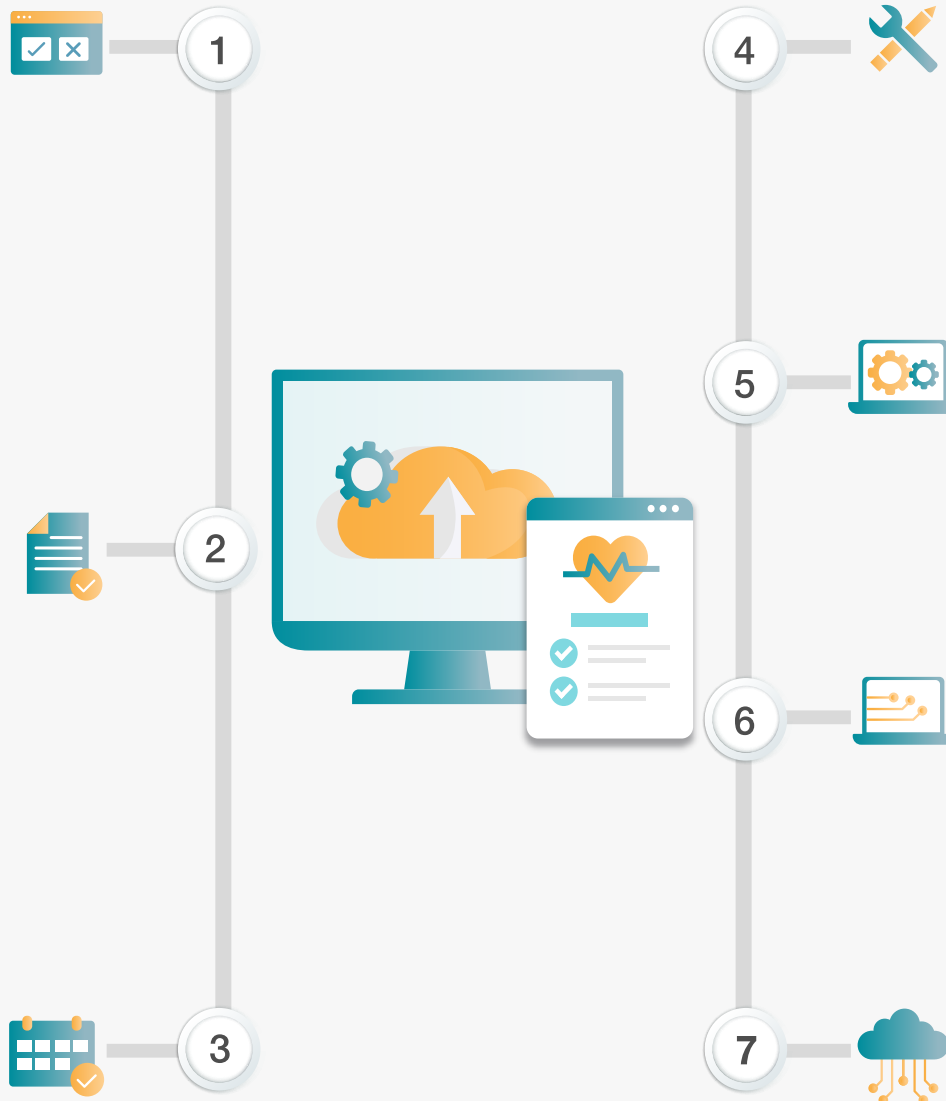

The community clinic initiates the process by submitting the ICC-Netcare Intake form to the Integration Coordination Centre (ICC) at icc@ahs.ca. Upon receipt, the ICC assigns an Engagement Manager (EM) as the clinic's primary contact for the project. The EM reviews the intake form for completeness and assesses the initiative's feasibility.

Readiness Assessment

Once the ICC EM determines feasibility, the clinic fulfills legal requirements and confirms Health Level 7 (HL7) message/report types. The ICC EM provides Alberta Netcare specifications. The clinic then completes the AHS Client Registry intake and creates sample messages/reports for evaluation.

Scheduling & Resourcing

The ICC EM will work with the Alberta Health Services (AHS) teams to schedule resources for the request based on their availability.

Development

Various AHS teams, including Alberta Netcare, Integration, and the Diagnostic Imaging team, undertake development efforts for the initiative.

Testing

Two rounds of testing are conducted: Functional testing for report accuracy and filing in Alberta Netcare, followed by user testing in the Alberta Netcare test environment.

Dark Deployment

Results are sent to the live Alberta Netcare environment but are not yet viewable to all users. This stage allows for another round of results verification before launch.

Go-Live

Upon successful completion of the Dark Deployment phase, the results are set to a viewable state in Alberta Netcare, allowing all Alberta Netcare users to view the results from the clinic.
